AureonCare
Health | Efficiency | Growth

EXECUTIVE BRIEF · OCTOBER 2026 RELEASE

One practice. One record. Booked to paid.

AureonCare runs a medical practice on a single patient record. The calendar, the chart, the claim and the books are one system, so nothing is typed twice and nothing goes missing between departments.

PREPARED FOR THE
CHIEF EXECUTIVE OFFICER
AND THE CHIEF MARKETING OFFICER

APP.AUREONCARE.TECH

Every handoff between systems is a place where money and safety leak.

A typical practice books in one tool, charts in another, bills through a clearinghouse portal and keeps its accounts somewhere else again. The patient's details are retyped at every boundary. Each retype costs staff time, and each slip shows up later as a denied claim, a missed allergy or a payment nobody can match.

AureonCare removes the boundaries. One record follows the patient from the first booking to the last payment, and every department works on that same record. The front desk, the clinician, the billing team and the finance office are looking at one set of facts.

ONE PATIENT, START TO FINISH

01 · SCHEDULING

Booked

The front desk books a video visit. Patient, provider and time are entered once.

02 · TELEHEALTH

Seen

The session is built from the booking, so nobody pastes a link to the wrong person.

03 · CLINICAL

Documented

Findings, the prescription and the lab order go onto the same chart.

04 · BILLING

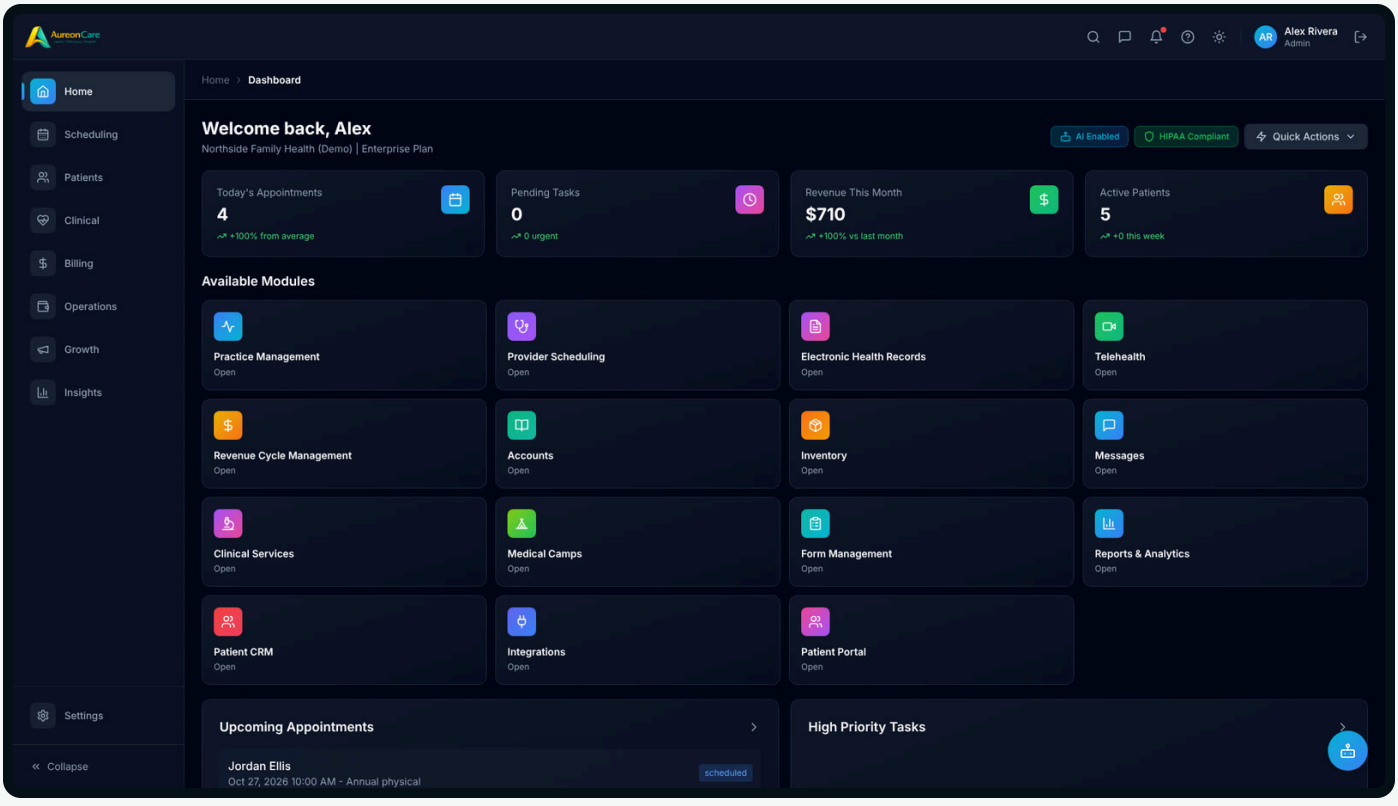

Claimed

The claim draws on the diagnoses already on the chart and is submitted as an EDI 837 file.

05 · ACCOUNTING

Paid

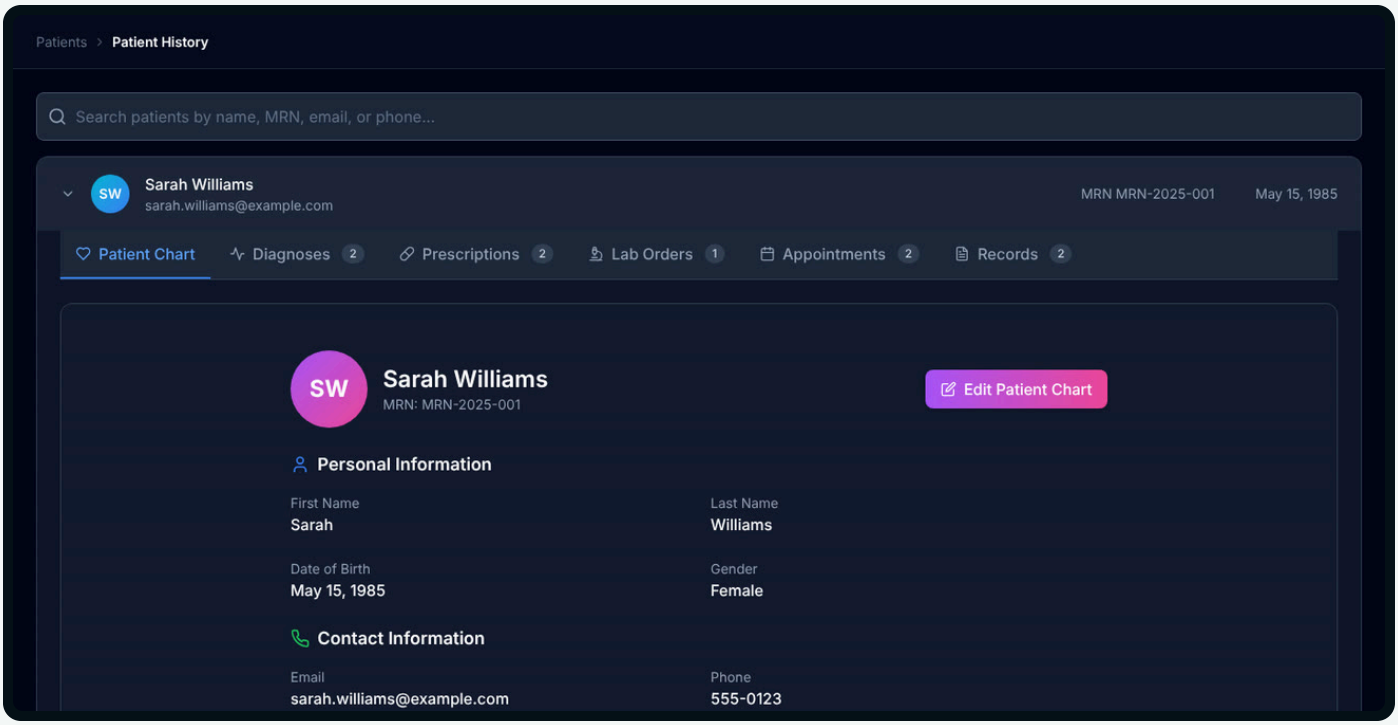

The payment posts against its claim and lands in the general ledger.

Home · every module behind one sign-in · demo environment, synthetic data

Chart it before the next patient sits down.

Clinicians stay in the record instead of working around it. Everything a visit needs sits behind one patient's tabs.

Patients ▸ Patient History · MRN-2025-001 · one record, six tabs · demo data

The longitudinal chart

History, diagnoses, prescriptions, lab orders, appointments and documents on one timeline. SOAP notes are written against the diagnosis.

Prescribing with checks

Medications are searched, never free-typed, and checked for interactions before they join the active list. A `Surescripts` connector is built in.

Labs ordered by code

Tests are ordered by their code, so the lab and the claim describe the same test. A `LabCorp` connector is built in.

Coding at the point of care

`ICD-10` diagnoses and `CPT` procedures from a searchable code set. The claim form picks up the diagnoses already on the chart.

Video visits from the record

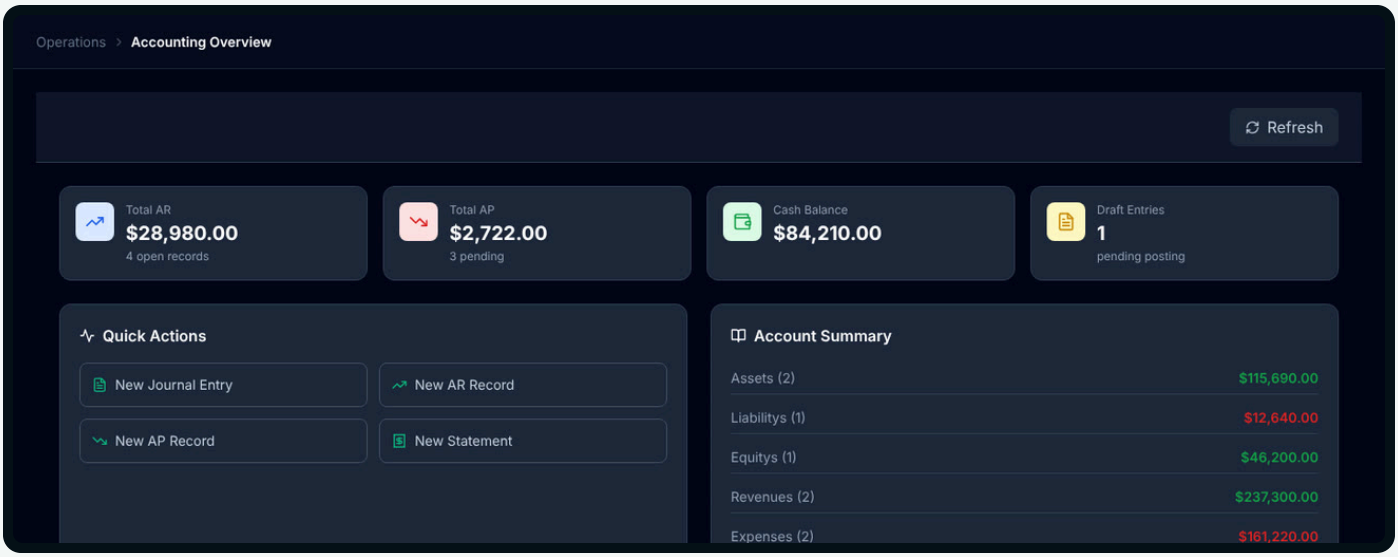

Connect the platform the practice already uses: Zoom, Google Meet, Microsoft Teams or Webex. Sessions are created from the booking.

Intake before arrival

Intake packets and consent forms are completed ahead of the visit and land on the chart. Every form version is kept.

See the whole business, from the front desk to the general ledger.

Most practice systems stop at the claim. AureonCare carries on into the accounts and the stockroom, so the figures a chief executive reviews come from the same place the work happens.

Operations ▸ Accounting · a double-entry ledger inside the practice system · demo data

The full revenue cycle

Pre-authorizations tracked to a decision. Claims submitted as `EDI 837`. Denials logged with their reason code and the amount at stake. Payments posted against the claim they settle. An `Optum` connector is built in.

A real general ledger

Double-entry accounting inside the practice system: chart of accounts, journal, receivables, payables, bank reconciliation and financial statements.

Inventory and purchasing

Items, stock levels and low-stock alerts, suppliers, and purchase orders followed through to receipt.

Patient billing

Quotes that become invoices, card payments through Stripe, and coupons, all tied to the same patient record.

More than one site

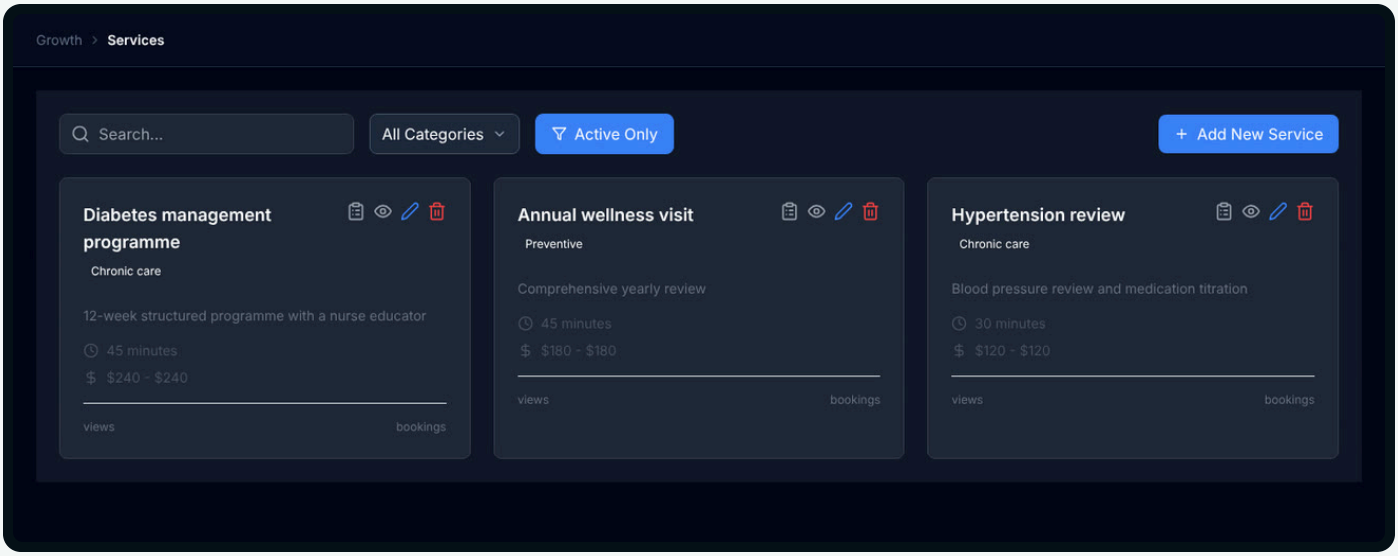

Every clinic, borrowed venue and mobile unit is a site, so a report can say which site as well as how much.

Deployed on your terms

Four plans, up to On-Premises or Customer Cloud for organisations that must keep patient data inside their own environment.

Fill the calendar, and know which effort filled it.

Patient acquisition and retention run inside the same record as care. A campaign, the booking it produced and the follow-up visit after it are linked from the start, not reconciled by hand at the end of the quarter.

Growth ▸ Services · priced, bookable programmes · demo data

Patients book themselves

A public booking page for each provider. Patients choose a service and a free slot without creating an account, and the booking lands on the calendar.

A waitlist that refills the gaps

When a slot opens, the next suitable patient is notified. Priority and flexibility decide who, rather than who asked first.

Campaigns and reminders

A patient pipeline, email and WhatsApp campaigns and reminders, and a call queue for the front desk.

A catalogue that sells

Priced services, packages that show the saving, and time-limited promotions with their take-up tracked.

A portal patients use

Patients see their appointments, prescriptions, records and forms, and message the practice securely.

Reach in five languages

The product runs in English, Spanish, French, German and Arabic, so the practice can serve the community it actually has.

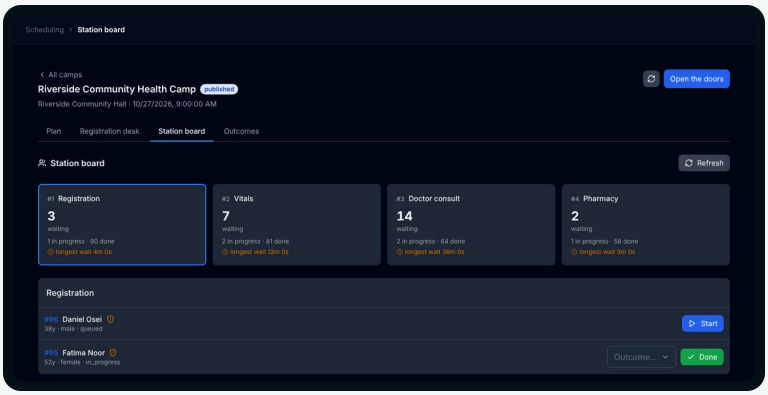

Four additions that take the practice beyond its own walls.

OUTREACH

Medical camps

Plan the venue, services, staff, stations and supplies. Register walk-ins at the gate with a queue token, watch every station's queue live, and close with an outcomes report showing how many attendees went on to book at the practice.

Rostering a clinician who already has clinic appointments that day is flagged before it happens. The sponsor report holds counts only, with small groups combined so no one can be identified.

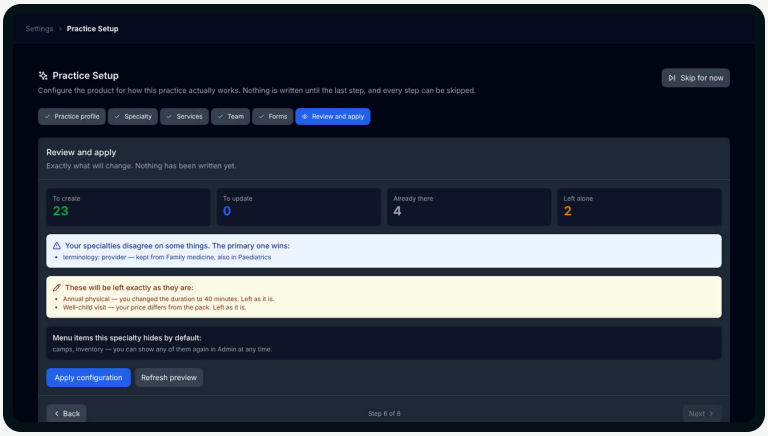

Medical camps ▸ Station board · demo data

CONFIGURATION

Specialty setup

Starter content for 36 specialties: services, appointment types and forms. A preview shows exactly what will change before anything is written.

Anything the practice has already edited is reported and left alone. A later update will not restore the vendor's version over yours.

Settings ▸ Practice Setup · 23 to create, 2 left alone · demo data

OPERATIONS

Locations

Clinics, community venues and mobile units are all sites. One is primary, and deactivating a site keeps every record that already refers to it.

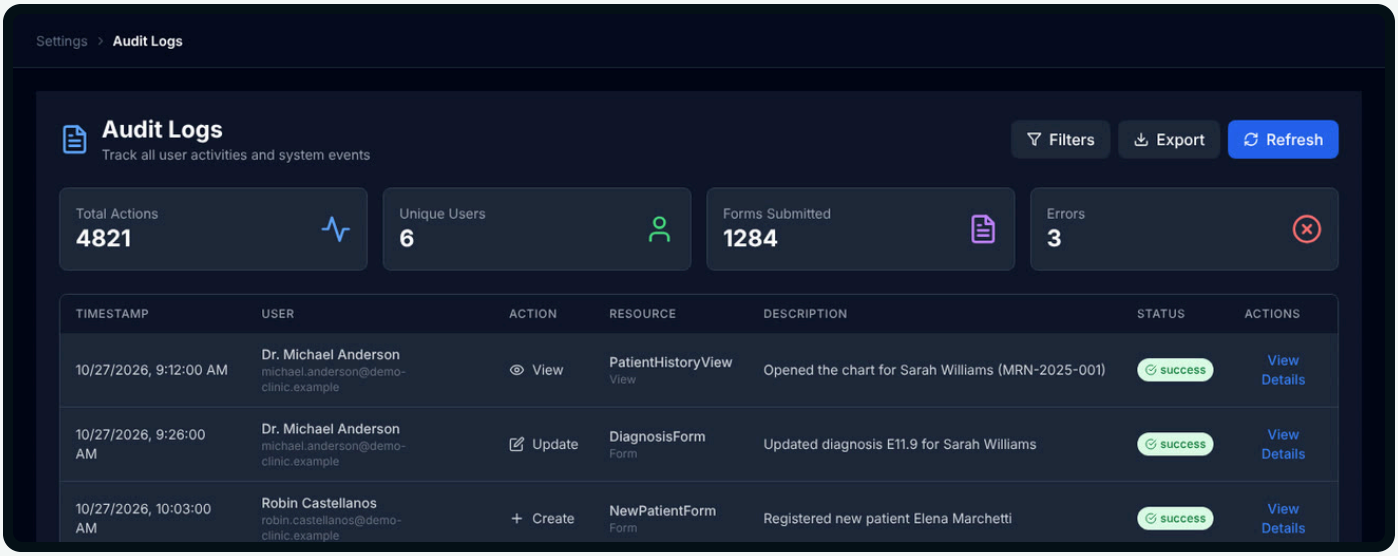

MOBILE

The mobile app

One app for phone and tablet, with four shells chosen by role: patient, clinician, front desk and administrator. It enforces the same permissions as the web.

Know who opened a chart, and show why they were allowed to.

Governance is part of the product. The answers a board, an auditor or a patient will ask for are kept as the work happens, rather than assembled afterwards.

Settings ▸ Audit Logs · views are logged as well as changes · demo data

An audit trail that records reads

Every create, update, delete and export is logged with the user, the time and the address. So is every view: opening a chart leaves a trace.

Access by role

View, create, edit and delete rights set per role and per module, with custom roles for the way the practice is organised.

Two-step sign-in

Authenticator-app verification at sign-in, enrolled from a QR code.

Sealed backups

Backups are encrypted with `AES-256-GCM` before they leave the server and can be stored in Google Drive or OneDrive. A restore touches only the practice's own data and must be confirmed.

Archiving by rule

Older records move to an archive under rules the practice sets, and can be restored when they are needed again.

No lock-in

Records export as `FHIR R4`. A diagnosis becomes a Condition and a vital sign an Observation, readable by any system that speaks the standard.

EVERYTHING IN THE PRODUCT

Nine workspaces behind one sign-in.

1
PATIENT RECORD, SHARED BY EVERY DEPARTMENT

9
WORKSPACES, FROM SCHEDULING TO SETTINGS

36
SPECIALTIES WITH STARTER CONTENT

26
STANDARD REPORTS, PLUS A CUSTOM BUILDER

4
VIDEO PLATFORMS: ZOOM, MEET, TEAMS, WEBEX

5
LANGUAGES, INCLUDING ARABIC

4
MOBILE SHELLS, ONE PER KIND OF USER

4
PLANS, UP TO ON-PREMISES

PLANS AND CONNECTIONS

Start with what the practice needs today, and switch on the rest later.

The first three plans run the same product on the same record. Moving from Essentials to Clinical Pro or Enterprise switches modules on, and nothing is exported or re-entered.

PLAN 1	PLAN 2	PLAN 3	PLAN 4
Practice Essentials	**Clinical Pro**	**Enterprise**	**On-Premises or Customer Cloud**
Scheduling, the clinical record, patient portal, messages, forms, reports, accounting and inventory.	Adds telehealth, the revenue cycle, CRM, medical camps and the service catalogue.	Adds third-party integrations for e-prescribing, labs, claims and more.	Enterprise, run inside the organisation's own environment.

BUILT-IN CONNECTORS

Zoom · Google Meet · Microsoft Teams · Webex · Stripe · Surescripts · LabCorp · Optum · WhatsApp · Google Drive · OneDrive · FHIR R4 · EDI 837

Connectors are switched on with the practice's own account for each service.

SEE IT WORKING

Twelve short films follow real work through the product, from a single booking to a medical camp. Each one runs in the live application with synthetic data.

M1	One patient, booking to bank deposit
M2	Friday, 4:07pm. The 3:30 just cancelled
M3	Chart it before the next patient sits down
M4	Who opened that chart, and when?
M5	You can’t collect what you can’t see
M6	Where does Tuesday keep going?
M7	The link is already on the chart
M8	Prior auth, without the fax machine
M9	Have you ever put one back?
M10	Two hundred people in a field, and a record for every one
M11	Which site was that?
M12	It will not overwrite the thing you changed

SEE IT RUNNING

One practice.
One record.

The fastest way to judge AureonCare is to book a patient, see them, chart the visit, claim it and post the payment, all in one place.
